## **INTRODUCTION**

Chinook salmon and steelhead trout originating from Lower Snake River Compensation Plan (LSRCP) hatcheries will constitute a significant portion of anadromous runs returning as adults to Idaho. A comprehensive evaluation is required and is being funded by the U.S. Fish and Wildlife Service to properly manage the LSRCP programs and the wild stocks with which these stocks are intermingled. The evaluation program requires the ability to identify individual fish groups that are harvested, returned to the hatchery or otherwise collected. Coded wire tagging has been and continues to be used for most studies to mass mark juvenile salmon and steelhead prior to release.

## **OBJECTIVES**

1. Remove, identify and record coded wire tags recovered from adult salmon and steelhead harvested or otherwise collected in Idaho.
2. Document contribution of Idaho LSRCP-reared fish in downstream Columbia River and ocean fisheries.

## **TECHNIQUES USED**

Chinook salmon and steelhead trout snouts were removed from appropriately fin-marked salmon and steelhead either in the harvest or at hatchery racks. Coded wire tags within the snouts were removed and decoded. Information from coded wire tags from salmon and steelhead recovered outside of Idaho was processed as received from other agencies. The information was entered on the existing coded wire tag data base.

## **RESULTS**

Tables 1, 2 and 3 summarize chinook salmon and steelhead trout tagged and released from LSRCP hatcheries in the fall of 1986 and spring of 1987.

Detailed recovery information for steelhead (run years 1984-1985, 1985-1986 and 1986-1987) and chinook (1984-1986) can be found in the Appendix. The total numbers may not equal the sum of the other three columns because some fish may delay their migration out of fresh water for an additional year, thereby delaying their return as adults. In this case, those fish would be 3-ocean fish, but are only counted in the total.
